7-Day Product Validation Sprint.

A practical way to investigate one problem before you spend weeks building a digital product.

Start with a decision, not a product.

By the end of this sprint, choose whether to build one small version, change your offer, or investigate a different problem. You are collecting evidence, not proving that an idea must work.

DAY 1	Choose one person, one task and one recurring obstacle.
DAY 2	Collect real examples and ask about the last time it happened.
DAY 3	Write a small offer and decide what result would justify continuing.
DAY 4	Create a useful sample and a clear product description.
DAY 5	Share the sample with relevant people where promotion is welcome.
DAY 6	Follow up, record actions and identify friction.
DAY 7	Review the evidence and choose your next step.

Keep the experiment small.

Set a daily time limit you can maintain. Use a document, a spreadsheet and a simple sample; you do not need a large audience or a finished store to learn about a problem. Extend the calendar if you cannot reach relevant people within seven days.

Inside the full guide

Problem research and interview prompts / a worked offer example / an honest outreach script / a small results log / a decision worksheet and delivery checklist.

This is an original practical framework, not a scientific study or a promise of sales. Small experiments reduce uncertainty; they do not establish market demand on their own.

Personal and own-business use. Do not resell or redistribute.
